LamiGel™ Mixing Instructions

LamiGel™ is to be mixed with no more than 100g per 2 litre of water for the correct consistency; extra water can be added for extra hydration purposes. The feed guide should always be consulted to manage daily amounts which can be split into smaller feeds. LamiGel™ is a complete feed and should not be fed in conjunction with any other feed except the hay/haylage or grass ration, however if a 'chewy' feed is required, then LamiGel™ should always be mixed with water first before adding to EquidChop™, LamiChop™ or any other non molassed chaff. The amounts shown for idle/light work can also be used when feeding LamiGel™ for hydration.

LamiGel™ should never be fed dry or sprinkled onto other dry feeds. A fresh, clean supply of water should always be available.
